

Mobile Safety Communications

Prevent incidents with the leading mobile safety communications platform and risk mitigation tool. LiveSafe delivers actionable, community-sourced safety and security intelligence that increases both workforce engagement and situational awareness for your security team, facilities staff and others in your organization.

The LiveSafe solution enables the human sensors in an organization (the employees, students, users, etc.) to surface security intelligence and risk insights about a broad range of categories. The LiveSafe platform then routes these insights to the appropriate internal business official, mirroring existing protocols. Through a secure, easy-to-use smartphone app, your entire organization becomes a communication channel for threat intelligence. Data is monitored in real time, and the flexible and configurable platform easily integrates into existing technology solutions to increase situational awareness.

The LiveSafe solution gives users numerous ways to send and receive safety information, without compromising privacy. And it delivers a suite of peer-to-peer and self-service tools to help employees stay safe in everyday scenarios without taxing the Security Operating Center or any risk mitigation resource. For the business stakeholders managing risk, the LiveSafe solution delivers easy-to-access command and control dashboard views, with real-time visibility into safety and security insights, and is the gateway to a rich set of employee communications tools. It also gives companies quick, clean access to their analytics to drive continual tuning of their security and risk profile implementation.

Key Features

- > Broadcast Messaging
 - Mass notifications via text message, push notifications, email and RSS feed.
 - Check-in capabilities for both drills and critical events.
 - Geo-targeted messaging so messages can be sent to team members in specific locations.
- > Mobile Two-Way Communication
 - Report tips are received in real time, are GPS tagged and can include text, photos, video and audio.
 - Active location sharing in an emergency shows where team members are with real-time data.
 - Security escort requests with time and location constraints are available via the dashboard or a phone call.

Key Benefits

- Offline access to emergency procedures like just-in-time training, contacts and internal procedures.
- Emergency contacts dynamically change to most relevant organization or agency depending on user location.
- SafeWalk™ peer-to-peer tool that allows people to virtually walk family, friends and other contacts to a destination.
- Views of important buildings, regions and safety places on a real-time map.
- An app that does not drain phone batteries, use a lot of device memory or require hardware to be installed.
- Reliable, high-capacity platform that can handle massive volumes of events, chats and broadcasts for large-scale incidents.
- Analytics on system usage and reporting are easily accessible.
